

Olesya Demyanova

Fun facts about the game

- Deal or No Deal game is most know as a popular American TV show.
- However, the Dutch were the originators of the show.
- Since then, most countries has also aired their versions of the game: for example in France it was called "À prendre ou à laisser"

- Even Meghan Markle (the wife of prince Harry) has starred in this TV show
- In US so far only 2 contestants have won 1 million dollars

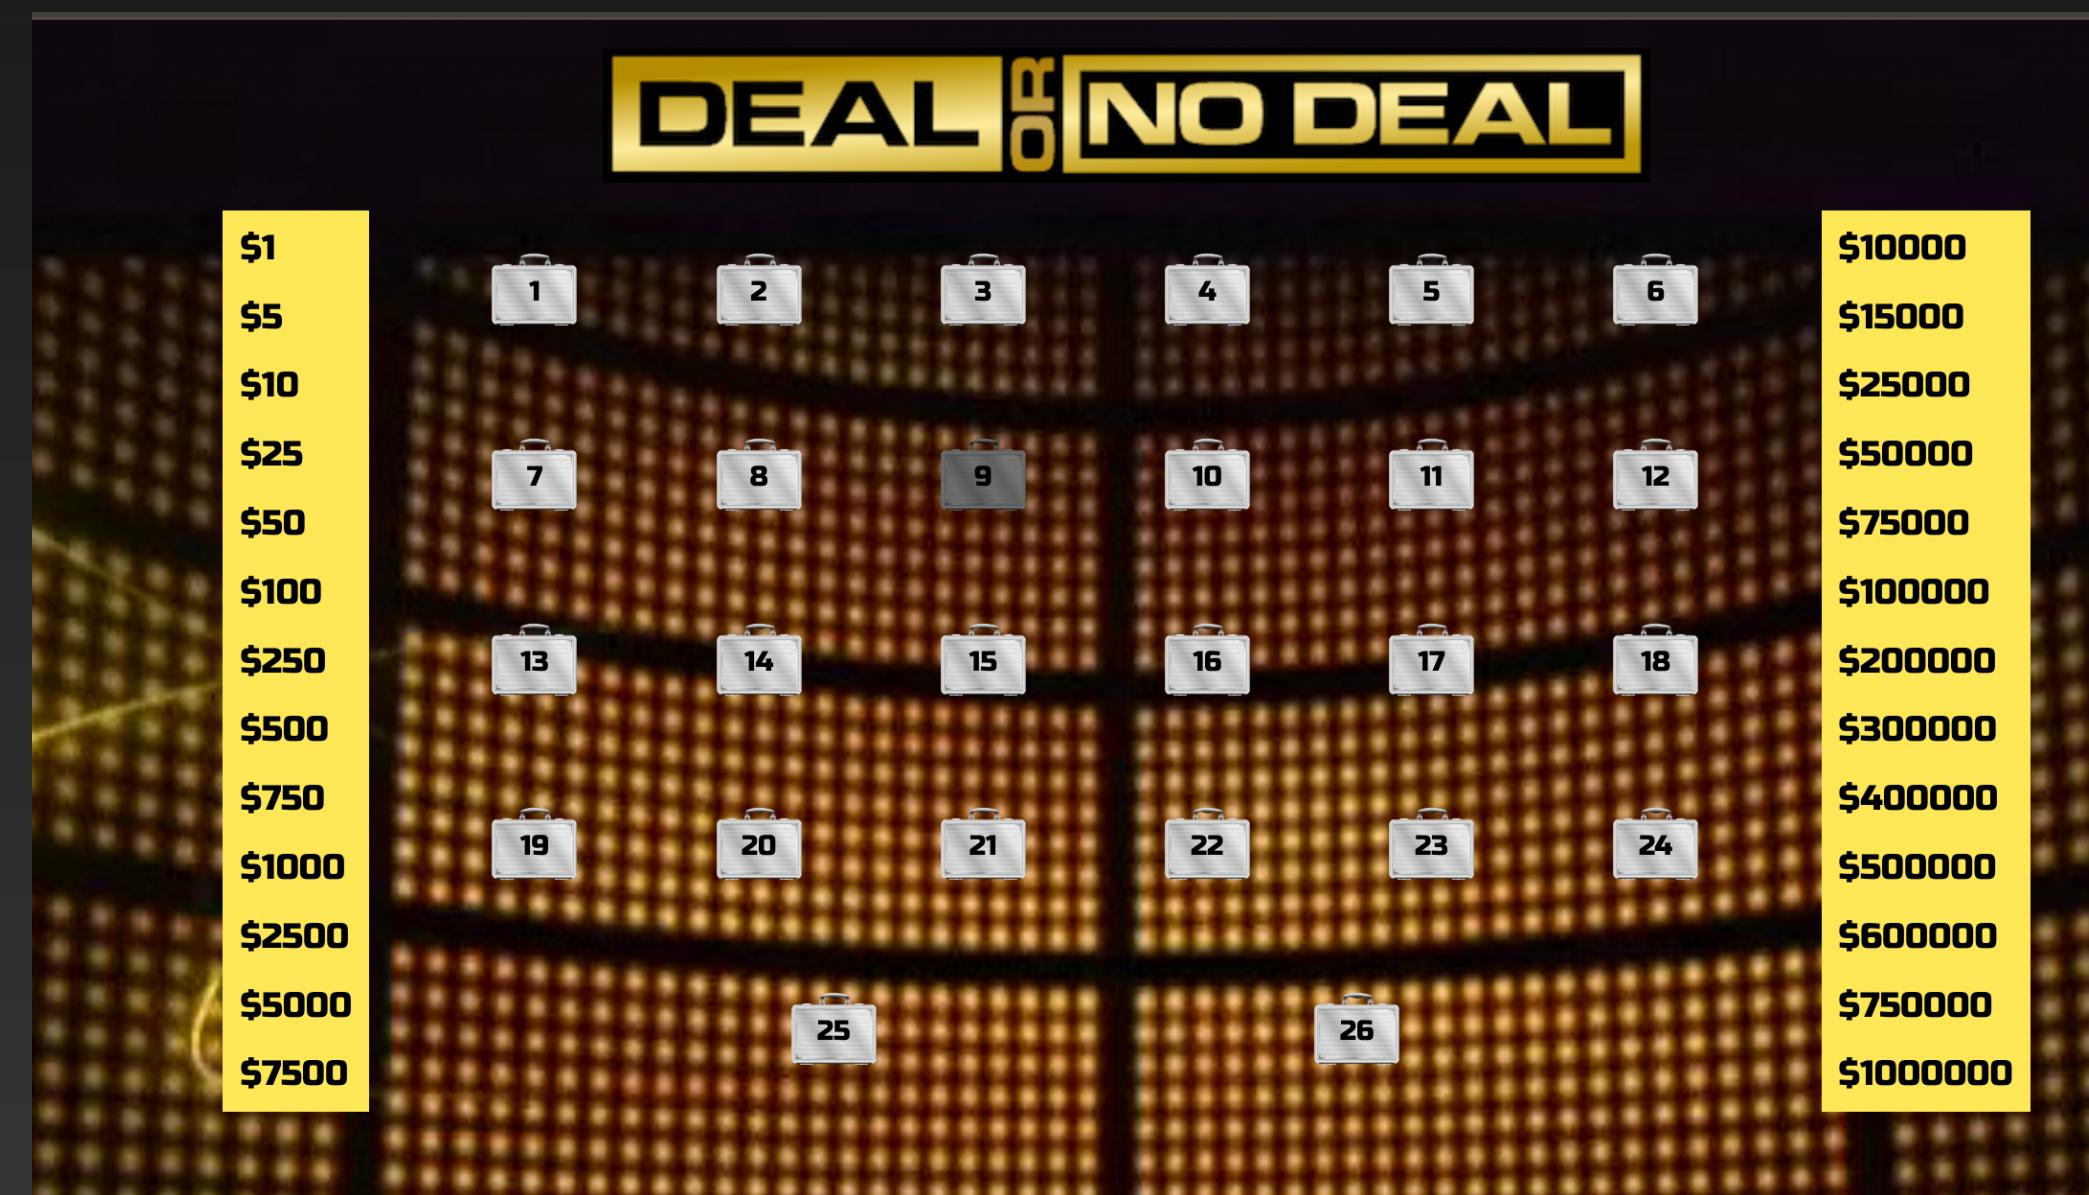

Why I chose this game:

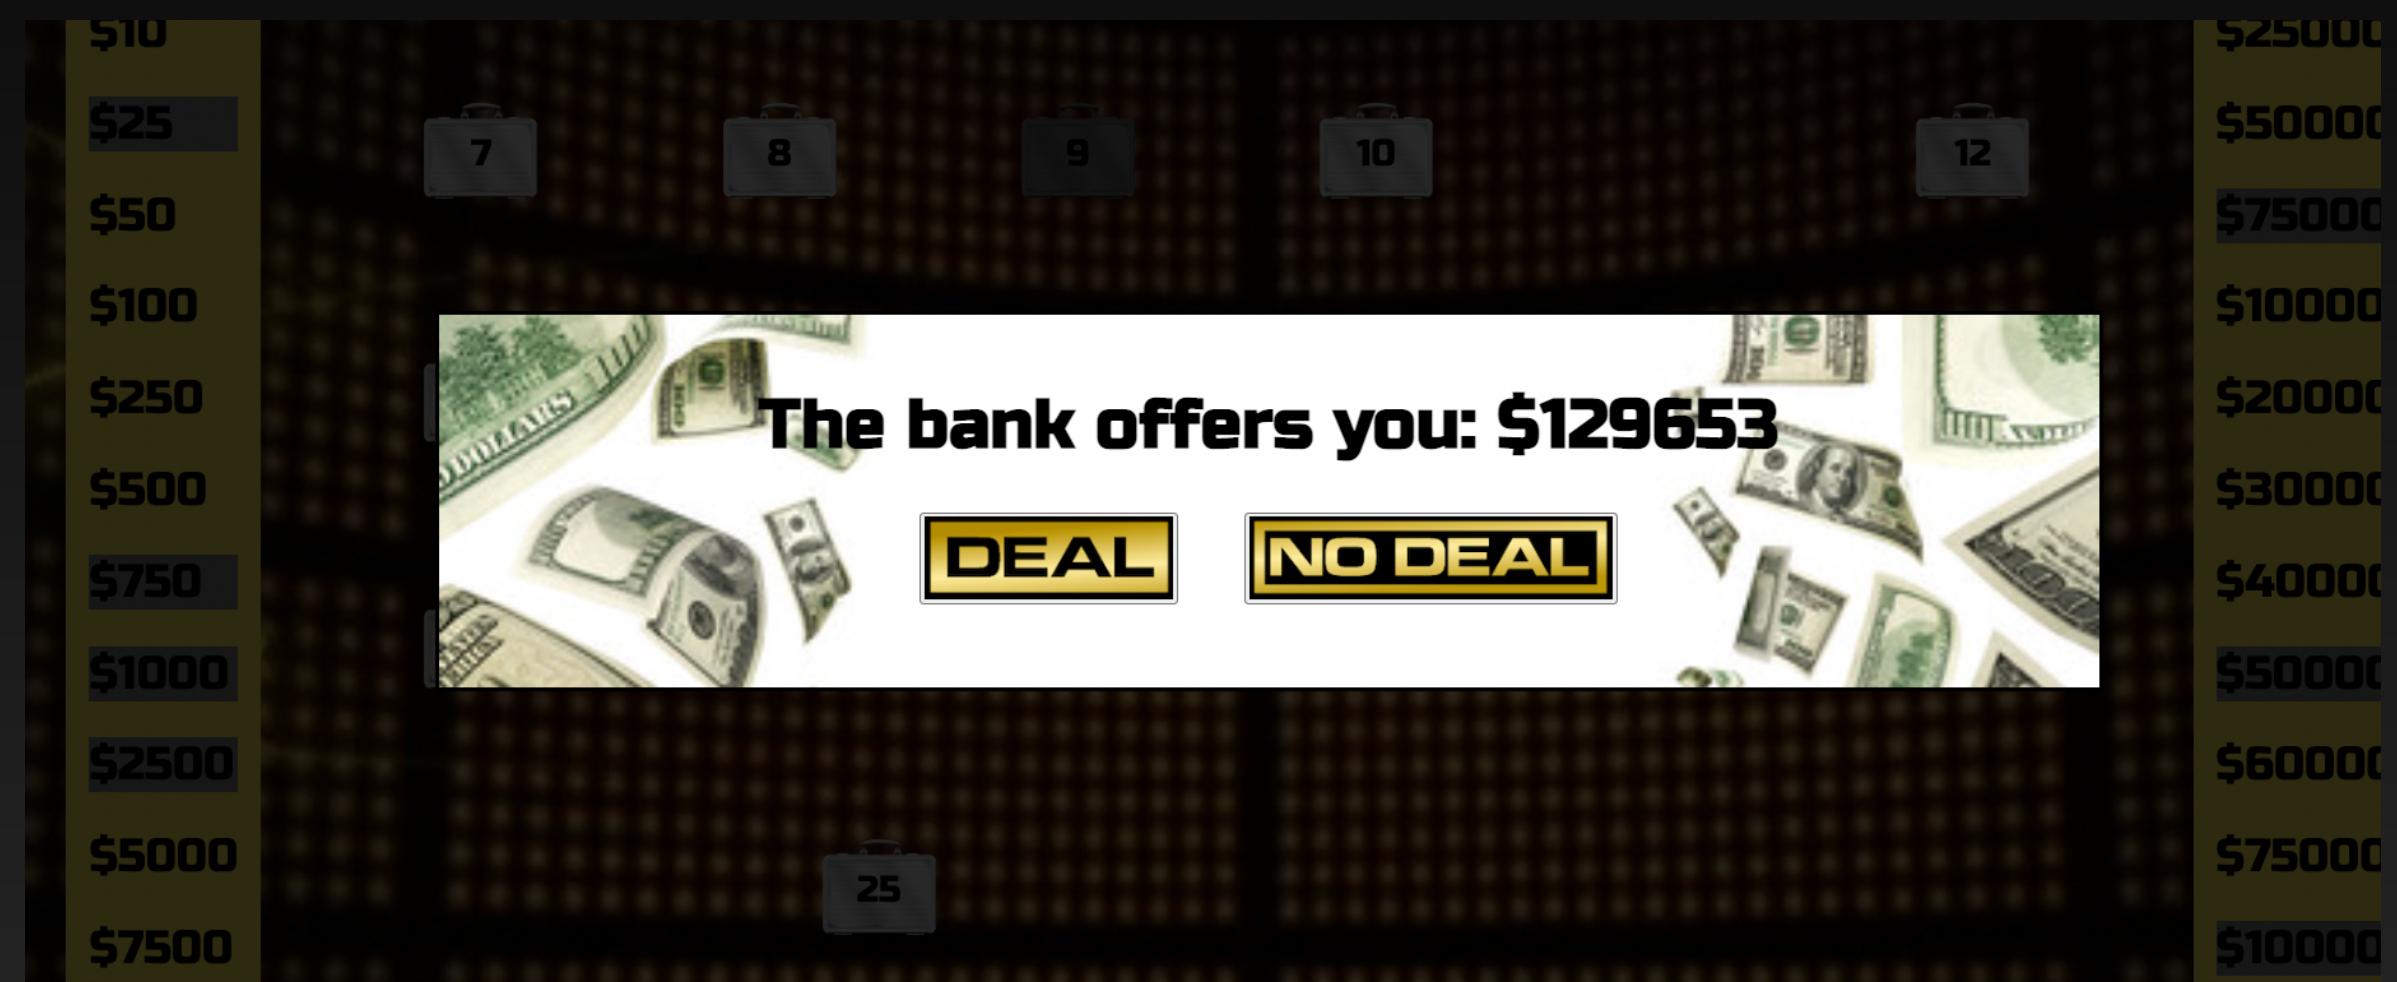

- I personally really enjoy playing it
- This game has a good opportunity to display all learned skills in HTML, CSS and JavaScript
- Has potential for further improvements

Rules

- At the beginning of the game, you choose your one lucky briefcase out of 26 (Each briefcase randomly contains cash value from \$1- \$1,000,000)
- Then the game starts, and the goal is to eliminate cases, that you think have the lower amounts of cash.

- After several opened boxes, you will receive a proposition from the banker. You will have an option to accept his deal, or to keep playing, trying your further luck

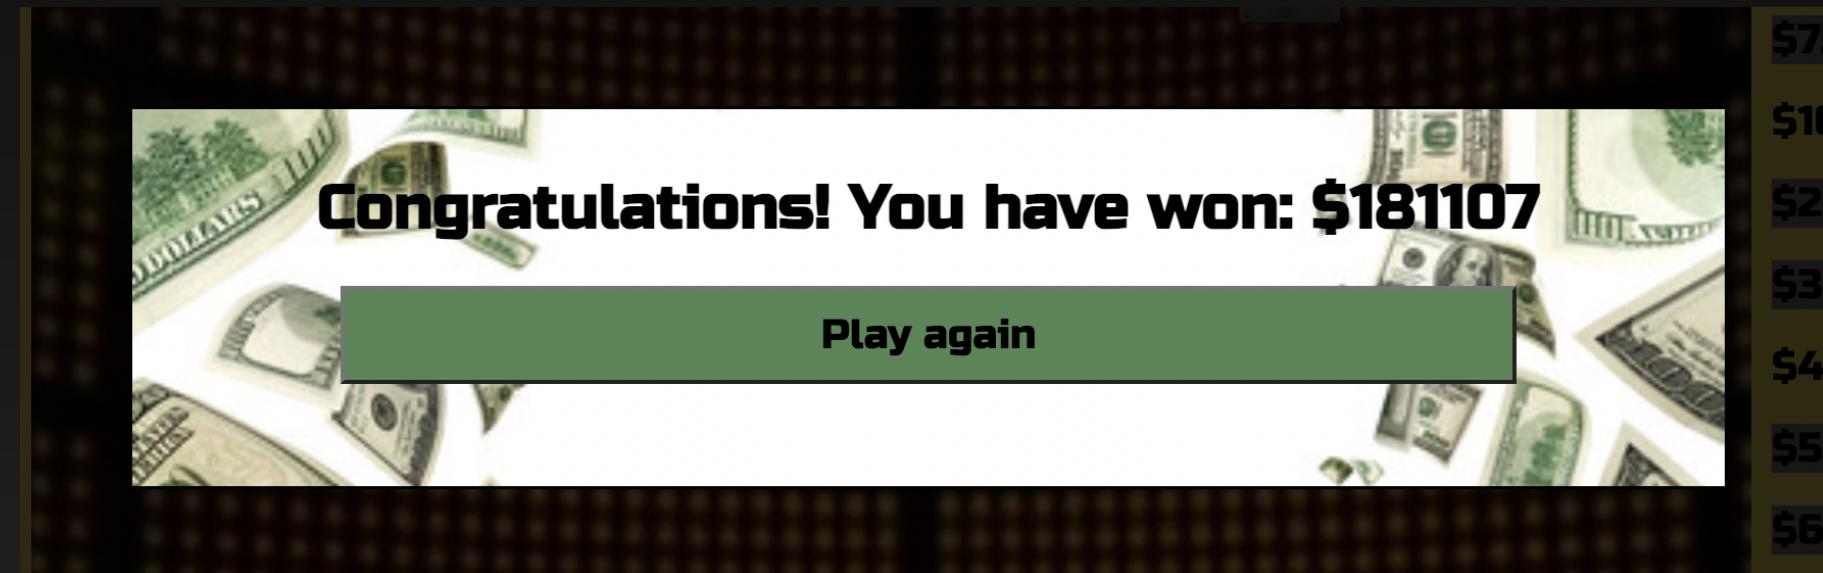

- Once only 2 boxes remain (the one you picked and the last one available) You will have again 2 options: Either keep your case or choose the banker's deal

DEAL

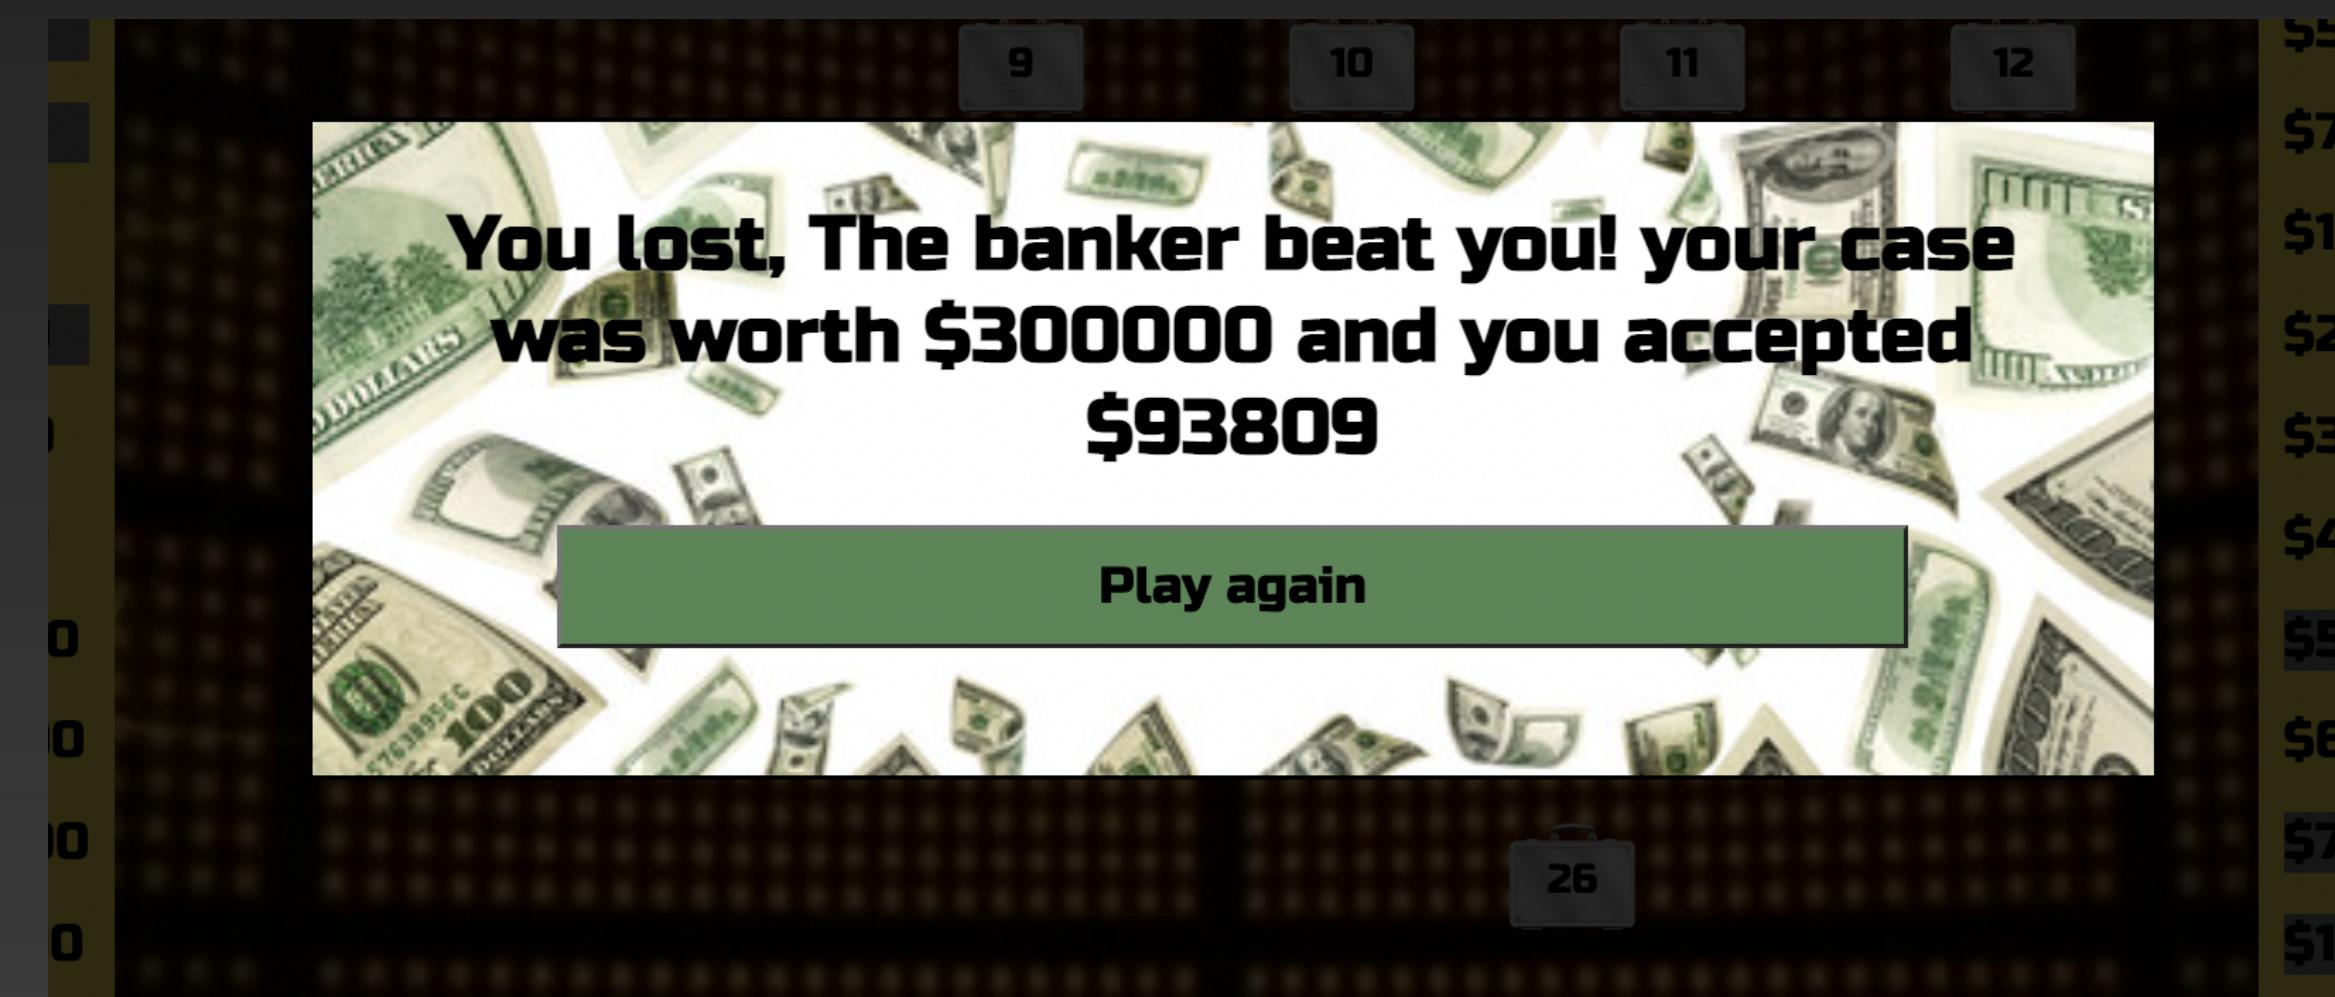

NO DEAL

Winning the game

- Any time you choose to accept the bankers deal, you will exit the game.
If the accepted deal was better than your original case, you will win the game.

- However if your case had bigger amount, you will loose the game

Demo

Technical challenges/Mistakes

- Not planning adequately how long each part will take
- Due to my own insufficient practice, had overall challenging experience
- Had trouble setting up correctly the restart of the game
- Better code organisation

Things I will improve

- Adding sounds according to the amount of money lost
- Would like to add animation of opening the cases
- Implement better banker's offer depending on probability and remaining cases to open

Thank you!
